                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The cryC gene encodes a delta endotoxin which is an insecticide effective against Coleoptera and Lepidoptera. The sequence was isolated from cDNA library, on a plasmid designated pEG212. The plasmid can be used to construct an expression vector which can be used to transform B. megaterium ATCC 35985. Colorado potato beetle larvae treated with a suspension of cultured cells were dead within one week. The protein can be used as pure crystals or in the form of B.t. spores.

                                                                                                                                                                                                                                                        The bt13 gene encodes a 66 kDa crystal protein (the Bt13 protein) which is believed to be the active protein in the crystal toxin (the Bt13 toxin) produced by Bacillus thuringlensis (B.t.) tenebrionis and B.t. S1. The patent is for a transformed plant cell which includes, inserted in its genome, the bt13 gene, or a fragment which encodes the 66kD crystal protein. Plant cells contg. DNA encoding this protein are protected against Choleoptera. Also new are plants (and their seeds) contg. these cells; a specific DNA sequence of 1760 b; the crystal

A number of these endotoxins have been found to be toxic to Damilinia ovis, the biting louse of sheep. The B.T. isolates which produce these toxins can be grown and the delta endotoxin which is produced can be recovered by standard procedures. The genes encoding these endotoxins can also be transferred to a suitable host via a recombinant vector and the resulting

                                                                                                                                                                                                                                                                                                                                                                                                            This sequence shows the amino acid sequence of CryIIIA protein. The promoter from the CryIIIA gene sequence was fused to the protein coding region of the CryBII gene (AAQ71027). The recombinant hybrid fusion gene expressed the CryBII crystal protein more efficiently than its native promoter. CryIIB encodes an insecticidal crystal protein isolated from Bacillus thuringlensis var. kurstakl. It

26-FEB-1993;
                                       This sequence shows the amino acid sequence of CryIIB protein. The promoter from the CryIIIA gene (AAQ71026) sequence was fused to the protein coding region of the CryBII gene. The recombinant hybrid fusion gene expressed the CryBII crystal protein more efficiently than its native promoter. CryIIB encodes an insecticidal crystal protein isolated from Bacillus thuringiensis var. kurstaki. It

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               describes new Bacillus thuringiensis Cry3Bb mutant proteins, and composition methods for producing them. The B. thuringiensis Cry3Bb CC polypeptide was modified to have improved insecticidal activity or cenhanced insecticidal specificity against a trarget insect. The composition in the primary sequence of the native or unmodified Cry3Bb CC polypeptide, wherein the substitution or deletion occurs at a position cc corresponding to from about amino acids 1-365 of the unmodified cry3Bb CC polypeptide sequence (AAY23207 represents the wild type Cry3Bb CC polypeptide sequence (AAY23207 represents the wild type Cry3Bb CC protein). The polypeptide can be used to kill coleopteran pests, CC especially by application to the environment. It is especially cuseful against southern corn rootworm and western corn root worm, CC (Dlabrotica undecimpunctata howardi Barber, and Dlabrotica virgifera vergifera LeConte respectively). The mutant cry3Bb polynucleotides CC can also be used to produce transgenic plants with increased con secticide resistance.

                                   The synthetic Btt gene sequence (AAT40340) differs from the native sequence as found in p544Pst-Met5 (AAT40341). Changes in amino acids occur in the synthetic sequence with alanine replacing threonine at residue 2 and leucine replacing the stop at residue 596 followed by the addition of 13 amino acids at the C-terminus. At least 33% of the codons and/or at least 11% of the nucleotides in the coding sequence of the native Bt gene are changed. By avoiding codon usage that are rare in plants, plants that have more Bt crystal protein than plants contg. the native Bt gene, and are thus more toxic to insect pests such as tobacco hornworm, can be
                                                                                                                                                                                                                                                        WPI; 1996-484994/48.

The invention relates to a novel synthetic Bacillus thuringiensis (Bt) Coxin gene (AAZ59994) which is expressed at a high level in descendant plant cells and encodes a pesticidal protein toxin. The synthetic gene was designed to be expressed in plants at a higher level than wild type CB the genes (e.g., AAZ59993). This was accomplished by altering the DNA CS sequence of of the native Bt gene such that it contained codons compared by highly expressed plant genes, had an A+T content comparable to that found in plant genes and contained a plant initiation sequence. Additionally, sequences that cause destabilisation, inappropriate CC polyadenylation, degradation and termination of RNA were eliminated, and sequences that constitute RNA hairpin and splice sites were avoided. The resulting synthetic Bt gene has at least 10% of its nucleotides altered as compared with the native Bt gene. The synthetic Bt gene is used to produce transgenic plants having cresistance to pests, particularly insects. The modifications produced in the coding sequence increases the level of expression of Bt toxin in plants. The present sequence represents wild-type Bacillus thuringiensis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2000-136460/12.

                                                                                                                                                                                                                                                                                                                                            The sequence is that of an insecticidal protein functionally eqivalent to a native Bt protein. Plant cells expressing the protein have protection against insect damage. Differences between this sequence an that of the wild type comprise the replacement of Thr(2) and STOP(596) with Ala and Leu resp. and the addn. of 13 AAs to the C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Synthetic insecticidal crystal protein gene - comprises DNA sequence encoding insecticidal protein functionally equiv. to bacillus thurigiensis (Bt) insecticidal protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Adang

                                                                       The synthetic Btt gene sequence (AAT40340) differs from the native sequence as found in p544Pst-Met5 (AAT40341). Changes in amino acids occur in the synthetic sequence with alanine replacing threonine at residue 2 and leucine replacing the stop at residue 596 followed by the addition of 13 amino acids at the C-terminus. At least 32% of the codons and/or at least 11% of the nucleotides in the coding sequence of the native Bt gene are changed. By avoiding codon usage that are rare in plants, plants that have more Bt crystal protein than plants contg. the native Bt gene, and archanged.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC a synthetic Bt gene (AAX59991). This gene is expressed at a high level CC in descendant plant cells and encodes a pesticidal protein toxin. The CC synthetic gene was designed to be expressed in plants at a higher level CC than wild-type Bt genes (e.g., AAX59991). This was accomplished by CC altering the DNA sequence of of the native Bt gene such that it contained CC codons preferred by highly expressed plant genes, had an A+T content CC comparable to that found in plant genes and contained a plant initiation CC sequence. Additionally, sequences that cause destabilisation, CC sequence. Additionally, sequences that cause destabilisation, CC eliminated, and sequences that constitute RNA hairpin and splice sites CC were avoided. The resulting synthetic Bt gene has at least 10% of its CC concludes altered as compared with the native Bt gene. The synthetic Bt CC transformed into plant cells. The gene is used to produce transgenic CC plants having resistance to pests, particularly insects. The level of CC expression of Bt toxin in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches 595;

                                                                                                                                                                                                                                                                                                    A polylinker was inserted into the XmmI restriction site at the carboxyl terminus coding region of B.thuringiensis var. tenebric (Btt) toxin. DNA encoding the gp64 viral membrane protein of Act was operably linked to the Btt toxin coding sequence via the polylinker. The gp64 gene sequences act as midgut targetting signals for bacterial endotoxins. Plasmid pFX7 was one of three different Btt/gp64 gene fusions that were constructed and its deduced amino acid sequence is given here.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Extending host range or toxicity of insecticidal proteins protein capable of binding to gut epithelium of insects

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           256
```

```
carboxyl terminus coding region of B.thuringiensis var. tenebriosis (Btt) toxin. DNA encoding the 9p64 viral membrane protein of ACNPV was operably linked to the Btt toxin coding sequence via the polylinker. The 9p64 gene sequences act as midgut targetting signals for bacterial endotoxins. Of three different Btt/gp64 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                chimeric; fusion protein; insecticide; AcNPV;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The effects of N- and C-terminal deletions (AAR99960) on the toxicity of the Coleopteran toxin (see also AAR99958) of Bacillus thuringiensis var. tenebrionis (B.t.t.) were examined. Mutant genes were expressed in E. coli and the truncated proteins were tested for activity against Colorado potato beetle. All the C-terminal truncations, even of only 4 amino acids (construct 5440), resulted in a loss of activity. The N-terminus of the toxin was more tolerant; a mutant toxin deleted of 76 amino acids (construct 5452) exhibited toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chimeric plant gene which expresses a Bacillus thuringiensis toxin protein - useful for prodn of plants which are toxic to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ş
                         Novel CryIIIA proteins AAW34811-41 were produced by alanine scanning mutagenesis of domain II of the CryIIIA protein of Bacilius thuriengensis. All that positions changed to alanine in these proteins are located in some of the solvent exposed loops and beta-strands directed towards or located at the molecular apex. The substituted amino acids have a relative solvent accessibility of at least 40%, or are a maximum distance of 3 amino acids away from an amino acid having at least 40% relative solvent accessibility. The novel CryIIIA proteins have an increased toxicity to Coleopteran insects, e.g. Colorado potato beetle, and can be used to combat, or improve plant resistance towards insects. Specifically, the toxicity of the present sequence towards Diabrotica Virgifera virgifera was tested. The ECSO value (concentration at which 50% feeding inhibition is observed) of the present protein was found to be >243 microgram per millilitre; compared to 7.45 microgram per comparing the protein is mutant protein is recognised as a "down mutant" for Diabrotica virgifera virgifera. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          US5659123-A

                                                                                                                                                                                                                                                                                                                                             B
                                                                                                                                                                                                                                                                                                                                                                           Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel CryIIIA proteins AAW34811-41 were produced by alanine scanning CC mutagenesis of domain II of the CryIIIA protein of Bacillus thuriengensis. All the positions changed to alanine in these proteins CC are located in some of the solvent exposed loops and beta-strands CC directed towards or located at the molecular apex. The substituted amino acids have a relative solvent accessibility of at least 40%, or are a CC maximum distance of amino acids away from an amino acid having at least 40% relative solvent accessibility. The novel CryIIIA proteins have an CC increased toxicity to Coleopterna insects, e.g. Colorado potato beetle, CC and can be used to combat, or improve plant resistance towards insects. Specifically, the toxicity of the present sequence towards liasects. CC virgifera wis tested. The ECSO value (concentration at which CC 50% feeding inhibition is observed) of the present protein was found to be 5.27 microgram per millilitre, compared to 7.45 microgram per CC mote: this sequence does not appear in the specification; it was created on information arounded.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

Novel CryIIIA proteins AAW34811-41 were produced by alanine scanning mutagenesis of domain II of the CryIIIA protein of Bacillus thuriengensis. All the positions changed to alanine in these proteins are located in some of the solvent exposed loops and beta-strands directed towards or located at the molecular apex. The substituted amino acids have a relative solvent accessibility of at least 40%, or are a maximum distance of 3 amino acids away from an amino acid having at least 40% relative solvent accessibility. The novel CryIIIA proteins have an

increased toxicity to Coleopteran insects, e.g. Colorado

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and can be used to combat, or improve plant resistance towards insects. Specifically, the toxicity of the present sequence towards Diabrotica virgifera virgifera was tested. The EC50 value (concentration at which 50% feeding inhibition is observed) of the present protein was found to be 4.11 microgram per millilitre, compared to 7.45 microgram per millilitre for the wild type CryIIIA protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               using information provided
cryIIIA gene; corn rootworm toxicity; CryIIIA protein; increased toxicity; Coleopteran insect; Colorado potat relative solvent accessibility; plant resistance;

Novel CryIIIA proteins AAW34811-41 were produced by alanine scanning mutagenesis of domain II of the CryIIIA protein of Bacillus thurlengensis. All the positions changed to alanine in these proteins are located in some of the solvent exposed loops and beta-strands

The substituted amino acids have a relative solvent accessibility of at least 40%, or are a maximum distance of 3 amino acids away from an amino acid having at least 40% relative solvent accessibility. The novel CryIIIA proteins have an increased toxicity to Coleopteran insects, e.g. Colorado potato beetle, and can be used to combat, or improve plant resistance towards insects. Specifically, the toxicity of the present sequence towards Diabrotica virgifera virgifera was tested. The EC50 value (concentration at which 50% feeding inhibition is observed) of the present protein was found to be 8.31 microgram per millilitre, compared to 11.60 microgram per notice: this sequence does not appear in the specification; it was created note: this sequence does not appear in the specification; it was created

                                                                                                                                                                                                                                                                                                  CC Movel CryIIIA proteins AAW34811-41 were produced by alanine scanning CC mutagenesis of domain II of the CryIIIA protein of Bacillus CC thuriengensis. All the positions changed to alanine in these proteins CC are located in some of the solvent exposed loops and beta-strands CC directed towards or located at the molecular apex. The substituted amino CC acids have a relative solvent accessibility of at least 40%, or are a CC maximum distance of 3 amino acids away from an amino acid having at least CC 40% relative solvent accessibility. The novel CryIIIA proteins have an increased toxicity to Coleopteran insects, e.g. Colorado potato beetle, CC and can be used to combat, or improve plant resistance towards insects. Specifically, the toxicity of the present sequence towards biabrotica CC virgifera wis tested. The EC50 value (concentration at which CC 50% feeding inhibition is observed) of the present protein was found to be >243 microgram per millilitre, compared to 5.55 microgram per CC recognised as a "down mutant" for Diabrotica virgifera virgifera. The CC significantly below the toxicity of the native CryIIIA protein. CC significantly below the toxicity of the native CryIIIA protein. CC using information provided.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC mutagenesis of domain II of the CryIIIA protein of Bacillus thuriengensis. All the positions changed to alanine in these proteins CC thuriengensis. All the positions changed to alanine in these proteins CC are located in some of the solvent exposed loops and beta-strands CC directed towards or located at the molecular apex. The substituted amino CC acids have a relative solvent accessibility of at least 40%, or are a CC maximum distance of 3 amino acids away from an amino acid having at least CC 40% relative solvent accessibility. The novel CryIIIA proteins have an CI increased toxicity to Coleopteran insects, e.g. Colorado potato beetle, CC and can be used to combat, or improve plant resistance towards insects. CC virgifera virgifera was tested. The ECSO value (concentration at which CC 50% feeding inhibition is observed) of the present protein was found to CC be 1.93 microgram per millilitre, compared to 5.55 microgram per CC mote: this sequence for annear in the specification if was created CC this process of the present protein was found to CC be 1.93 microgram per millilitre, compared to 5.55 microgram per CC mote: this sequence for annear in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

Ct thuriengensis of domain II of the CryIIIA protein of Bacillus

Ct thuriengensis. All the positions changed to alanine in these proteins

Ct are located in some of the solvent exposed loops and beta-strands

Ct acids have a relative solvent accessibility of at least 40%, or are a

Ct maximum distance of 3 amino acids away from an amino acid having at least

Ct increased toxicity to Coleopteran insects, e.g. Colorado potato beetle,

Ct increased toxicity to Coleopteran insects, e.g. Colorado potato beetle,

Ct and can be used to combat, or improve plant resistance towards insects.

Ct Specifically, the toxicity of the present sequence towards Diabrotica

Ct Virgifera virgifera was tested. The EC50 value (concentration at which

Ct of feeding inhibition is observed) of the present protein was found to

Ct of 156 microgram per millilitre, compared to 5.55 microgram per

Ct mote: this sequence does not appear in the specification; it was created

CC mutagenesis of domain II of the CryIIIA protein of Bacillus chiral there is of domain II of the CryIIIA protein of Bacillus chiral there is of domain II of the CryIIIA protein of Bacillus chiral there is the selection of Bacillus controlled in some of the solvent exposed loops and beta-strands coldishave a relative solvent accessibility of at least 40%, or are a calds have a relative solvent accessibility of at least 40%, or are a commanded to accessibility. The novel CryIIIA proteins have an increased toxicity to Coleopteran insects, e.g. Colorado potato beetle, concan be used to combat, or improve plant resistance towards insects. CC specifically, the toxicity of the present sequence towards insects. CC virgifera virgifera was tested. The EC50 value (concentration at which compared to 3.86 microgram per millilitre, compared to 3.86 microgram per compared to 3.86 microgram per millilitre, compared to 3.86 microgram per compared as a "down mutant" for Diabrotica virgifera virgifera. The conjusted as a "down mutant" for Diabrotica virgifera virgifera. The conjusted as a "down mutant" for Diabrotica virgifera virgifera. The conjusted with the toxicity of the matant protein for this Diabrotica per was created content the sequence does not appear in the specification; it was created content information out appear in the specification; it was created contents in formation out appear in the specification; it was created contents of the present in the specification; it was created contents of the present in the specification; it was created contents of the present in the specification; it was created contents of the present in the specification; it was created contents of the present in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 9; Page -; 22pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modified Bacillus thuringlensis CryIII proteins - with increased toxicity against insect pests, particularly Coleopteran insects, e.g. corn rootworm and Colorado potato beetle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 1997-424316/39

                                                                                                                                                    thurlengensis. All the positions changed to alanine in these proteins are located in some of the solvent exposed loops and beta-strands directed towards or located at the molecular apex. The substituted amino acids have a relative solvent accessibility of at least 40%, or are a maximum distance of 3 amino acids away from an amino acid having at least 40% relative solvent accessibility. The novel CryIIIA proteins have an increased toxicity to Coleopteran insects, e.g. Colorado potato beetle, and can be used to combat, or improve plant resistance towards insects. Specifically, the toxicity of the present sequence towards insects. Specifically, the toxicity of the present sequence towards Diabrotica collisions of the present sequence towards protein acceptable of the present protein was found to be 5.50 microgram per millilitre, compared to 2.42 microgram per millilitre for the wild type CryIIIA protein.

CC mate: this sequence does not appear in the specification; it was created contents the sequence does not appear in the specification; it was created contents the sequence does not appear in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş
